

Event Management System (MERN Stack) – Viva Questions with Answers

1. What is the main objective of your Event Management System project?

To allow users to view event packages, register/login, and book events while enabling admin to manage events and packages.

2. What technology stack did you use?

The project uses the MERN stack: MongoDB, Express.js, React.js, and Node.js.

3. What does MERN stand for?

MERN stands for MongoDB, Express.js, React.js, and Node.js.

4. Why did you choose the MERN stack?

Because it allows full-stack JavaScript development and provides fast and scalable web applications.

5. What is MongoDB?

MongoDB is a NoSQL database used to store data in JSON-like documents.

6. What is Express.js?

Express.js is a Node.js framework used to create backend APIs and handle HTTP requests.

7. What is React.js?

React.js is a frontend JavaScript library used to build user interfaces.

8. What is Node.js?

Node.js is a runtime environment that allows JavaScript to run on the server side.

9. What is a database?

A database is used to store and manage application data.

10. What collections are used in your project?

User, Package, Booking, and Event collections.

11. What fields are stored in the User collection?

Full name, email, password, and phone number.

12. What fields are stored in the Package collection?

Package name, description, price, images, and catering details.

13. What fields are stored in the Booking collection?

User ID, package ID, dates, location, phone number, guest count, and special request.

14. What is authentication?

Authentication verifies the identity of a user before allowing access to the system.

15. How did you implement authentication?

Using JWT tokens and login/registration APIs.

16. What is JWT?

JWT (JSON Web Token) is a secure token used for authentication.

17. Why use JWT?

It allows secure user authentication without storing session data on the server.

18. Where is JWT stored?

In localStorage on the client side.

19. What is middleware?

Middleware is a function that runs before a request reaches the route handler.

20. What is authMiddleware?

It verifies the JWT token to ensure the user is authenticated.

21. What is REST API?

REST API is a way of communication between client and server using HTTP methods.

22. Which APIs did you create?

User authentication APIs, package APIs, event APIs, and booking APIs.

23. Difference between GET and POST?

GET retrieves data while POST sends data to the server.

24. What is Axios?

Axios is a JavaScript library used to make HTTP requests.

25. What is routing in React?

Routing allows navigation between different pages in a React application.

26. What is React Router?

A library used for implementing routing in React applications.

27. What is a React component?

A reusable piece of UI code.

28. What is useState?

A React hook used to manage state in functional components.

29. What is useEffect?

A React hook used to perform side effects such as API calls.

30. What is useParams?

It retrieves URL parameters from React Router.

31. What is useNavigate?

It is used to programmatically navigate between pages.

32. What is PrivateRoute?

A route that allows access only if the user is authenticated.

33. Why restrict booking to logged users?

To track which user booked the event.

34. What is form validation?

Checking whether user input meets required conditions.

35. How did you validate dates?

By preventing past dates and ensuring the end date is after the start date.

36. What is responsive design?

Design that adapts to different screen sizes.

37. Why is UI important?

It improves user experience and usability.

38. What is CRUD?

Create, Read, Update, and Delete operations.

39. Where are CRUD operations used?

Admin manages packages and events using CRUD operations.

40. What is Mongoose?

Mongoose is a library used to interact with MongoDB using schemas.

41. What is schema?

A structure that defines the fields of a database document.

42. What is a model?

A Mongoose model is used to interact with a MongoDB collection.

43. What is ObjectId?

A unique identifier generated by MongoDB.

44. What is password hashing?

Converting passwords into encrypted format before storing.

45. Which library used for hashing?

bcrypt.

46. Why use bcrypt?

To securely store user passwords.

47. What is HTTP status code 200?

It means the request was successful.

48. What is HTTP status code 401?

It means unauthorized access.

49. What is HTTP status code 404?

It means resource not found.

50. What is HTTP status code 500?

It means server error.

51. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

52. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

53. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

54. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

55. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

56. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

57. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

58. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

59. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

60. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

61. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

62. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

63. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

64. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

65. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

66. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

67. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

68. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

69. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

70. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

71. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

72. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

73. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

74. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

75. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

76. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

77. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

78. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

79. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

80. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

81. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

82. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

83. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

84. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

85. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

86. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

87. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

88. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

89. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

90. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

91. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

92. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

93. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

94. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

95. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

96. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

97. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

98. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

99. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.

100. What is an important concept used in your project?

Concepts include authentication, REST APIs, database management, and frontend■backend integration.
